

- Opiates include: morphine, codeine, methadone, oxycodone (Oxycontin, Percodan, Percocet), hydrocodone (Vicodin, Lortab, Norco), fentanyl (Duragesic, Fentora), hydromorphone (Dilaudid, Exalgo)
- Anyone can be at risk from people with a substance use disorder, people struggling with chronic pain, to young athletes with a sports injury
- Naloxone is a medication that is used for any suspected opiate overdose
- You can't use naloxone on yourself
- Anybody with a personal history of overdose is 29 times more likely to die of overdose in their lifetime
- Naloxone temporarily reverses opiate overdose for 30 to 90 minutes
- Naloxone is shown to reduce drug use in communities with harm reduction programs because of education
- Naloxone is only part of the treatment for overdose it is still important to make sure the person who overdosed gets to the hospital for medical treatment

Co-Occurring Disorders

Call 911

Always call 911 if you know of
someone who is experiencing an
overdose. A safer way to call 911 if
someone is worried about the
police showing up is to say
someone is **unresponsive or not
breathing**

- **Michigan law protects people who use naloxone during an overdose from civil charges if any adverse outcome occurs because of the naloxone administered**
